Strength and Wearability

Webster's new Super Duralloy pin gives the unprecedented combination of strength, flexibility and wear resistance to provide the most reliable pin in the industry.

This special alloy steel pin provides increased hardenability (heat treat properties) which allows for a more thorough heat treatment of the Super Duralloy pin. This gives the Super Duralloy pin a more constant wear resistance zone that goes deep into the core of the pin.

As other manufacturers move production toward low cost, low quality manufacturing alternatives, Webster continues to utilize domestic innovations that provide process and material improvements which separate our chains from the rest of the world. These improvements provide our customers increased reliability, chain life and ultimately profitability.

"Increasing Customer Profitability since 1876"
